

Difference between == and === :

== only checks the value between two species.

=== checks both the value and type of both species.

Example :

```
3===3?
```

Output : True

```
"3"==3?
```

Output : True (which is actually false, hence we use ===)

```
"3"===3?
```

Output : False

Ternary Operators:

```
let number = 5;
```

```
(number % 2 === 0) ? console.log("Even") : ("Odd");
```

Output: Odd
